                                                                                                                                                                                                                                                                                                                                                      "Metabolic regulation of asparagine synthetase gene expres maize (Zea mays L.) root tips.";
PLANT J. 9:1-11(1996)
-I- CATALYTIC ACTIVITY: ATP + L-ASPARTATE + L-GLUTAMINE =
PYROPHOSPHATE + L-ASPARACINE + L-GLUTAMATE.
-I- PATHWAY: ASPARACINE BIOSYNTHESIS.
-I- SIMILARITY: THE GATASE DOMAIN BELONGS TO TYPE-2 GLUTAM AMIDOTRANSFERASES.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  INIT_MET

Statistics: Mean 27.267; Variance 32.331; scale 0.843

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

disease and which binds to the polypeptide to activate autoreactive T-cells in individuals with the autoimmune disease. This peptide is derived from the human desmoglein 3 protein (amino acids 251-265) and is implicated as a self epitope in pemphigus vulgaris. Peptides derived from the human desmoglein protein are described in W04841-47. Sequence 15 AA;	tolerising an individual to that polypeptide. In both cases, the polypeptide (whether self or non-self) includes an amino acid sequence corresponding to a sequence motif for a MHC class II protein, such as HLA-DR, which is associated with a human autoimmune	<pre>8pp; Engl arations human nor hich is o isolated</pre>	wPI; 96-425218/42. Pemphigus vulgaris auto-antigens and multiple sclerosis non-self antigens - useful in disease treatment, and method for aldentification of other self and non-self antigens implicated in anti-impure disease.                                                                                                                                                                                                     Fused protein recognised by pemphigus vulgaris auto:antibody useful to treat and diagnose pemphis vulgaris Claim 1: Page 7-9: 9pp; Japanese.

W07908 represents the human pemphigus vulgaris (PV) antigen extracellular region. The PV antigen is produced in patients wit pemphis vulgaris resulting in autoimmune disease. PV is a rare relapsing disease causing suprabasal, intra-epidermal bullae (vesicles) of the skin and mucuous membranes, which is fatal if untreated. The PV antigen was fused to a human IgG1 hinge region and the resulting fusion protein is useful to treat or diagnose
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        DNA encoding pemphigus vulgaris antigen - useful in proteins for diagnostic and therapeutic uses Disclosure, Fig 7: 50pp; English.

This sequence is the pemphigus vulgaris 130kD antigen. The protein and its encoding DNA may be used in the diagnosis and treatment of pemphigus vulgaris. It is thought that the antigen may be a ceil adhesion molecule.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    29-JAN-1997 (first entry)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         pemphigus foliaceus antigen-IgG constant region fusion protein - linked through the hinge region used to treat pemphigus foliaceus Claim I; Page 10:12; 17pp; Japanese.

This sequence represents a fused protein recognised by pemphigus foliaceus patient autoantibody which comprises the constant region of IgG linked to the extracellular region of pemphigus foliaceus is antigen protein through the hinge portion. Pemphigus foliaceus is antigen protein through the hinge portion. Pemphigus foliaceus is a chronic, generalised, vesicular and scaling skin eruption similar to dermatitis herpetiformis. The pemphigus foliaceus antigen fusion protein is useful to treat pemphigus foliaceus. The antigen is especially administered through an adsorbent upon which the fusion protein is immunobilised via a carrier. The fusion protein is also useful for detecting pemphigus foliaceus antibodies which is useful immunodiagnosis. The fusion protein has little or no side effects.
                                                                                                                                                                                                                                                                                                                                                                                                                                                       Query Match

Polynucleotide(s) encoding human protocadherins pc3 and pc4 and rat pc5 - involved in cell-cell adhesion and regulation activities Claim 15; Page 115-119; 146pp; English.

R86865-R86867 represent the sequences for three protocadherins. Th sequence represents the human protocadherin pc3. These sequences a related to cadherin, and possess cell adhesive ability. Cadherins glycosylated integral membrane proteins that are involved in cell-c

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 밁
                                                                                                                                                                               FIT Human and rat cadherin polypeptide(s) - mediate cell-cell adhesion
PS Claim 1; Column 69-72; 56pp; English.

CC This sequence represents human cadherin-5. The invention specifically
CC provides details of human cadherin-5, -8, -11, -12 and -13, and rat
CC cadherin-8, -5, -11 and -13. Cadherin are calcium-dependent cell
CC adhesion proteins. They are glycosylated integral membrane proteins
CC that have an N-terminal extracellular domain that determines binding
CC specificity, a hydrophobic membrane spanning region and a C-terminal
CC sytoplasmic domain, which is highly conserved among members of the
CC through eatenins and other cytoskeleton-associated proteins. The
CC convel cadherin proteins may be used in the analysis of the role of
CC cadherins in various cancers. Sequence analysis of the cadherin
CC cadherin also allows investigation of the structure and function of
CC cadherin. The cadherin proteins may be isolated by using anti-cadherin
CC anthodies. These antibodies may also be used to modulate the activity
CC featherin and to determine the tissue specific distribution of cadherin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Matches

The cytoplasmic domain interacts with the cytoplasmic domain is and other cytoskeleton associated proteins. The cytoplasmic domain is not present in all cadherins, but in those which possess it, it is essential for the cadherins adhesive function. The cadherins which do not possess a cytoplasmic domain appear to function via a different method from those with a cytoplasmic domain. These sequences were isolated using primers 1 and 2 (see T03575 and T03576) The proteins may have regulatory functions in the cell, as well as the cell-cell adhesive properties. Antibodies produced against these sequences are useful for modulating the binding activity of these protocadherins, and can be used therapeutically.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  protocadherins, an secuence 787 AA;

The present sequence is used to demonstrate the method of the invention. The specification describes the comparison of DNA base sequences. The method involves 3 steps of: (1) division of a first and second nucleic acid sequence into base groups of three base lengths, and translation into amino acids; (2) all base and amino acid insertions and deletions of the two nucleic acid sequences are observed and the amino acid sequences encoded by these nucleic acid sequences are compared; and (3) adjacent bases and amino acids are compared and step (1) repeated after shifting the translation frame by one base towards the 3' end or shifting the translation frame one base towards the 3' end, but
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     on homologous rat cacherin cDNA.

Antibodies or fragments that specifically bind the human can be used to purify the cacherin, determine its tissue and antagonise its ligand/antiligand binding activities.

The present sequence is full length human cadherin-5, which
is a Ca2+ dependent cell adhesion protein. The human cadherin
was isolated from a placental cDNA library, using probes based
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         WPI; 97-108328/10.

Example 5; Figure 9; 34pp; English.

Integrins are heterodimers comrised of alpha and beta subunits, that are non-covalently associated transmembrane glycoproteins. Il alpha chains and 6 beta chains have been recognised in man. Each alpha subunit tends to associate with only one type of beta subunit but there are several exceptions. Integrins mediate (in part) the interaction of cells with the extracellular matrix, forming a link between the extracellular matrix and the cytoskeleton. They may transmit signals from the extracellular to the intracellular environment, affecting cell behaviour. This sequence is the beta4 subunit of an alpha6 beta4 integrin.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                CC C-terminus of the fourth extracellular subdomain (EC-4) were CC identified. The corresp degenerate oligos (068949, 068950) were CC designed for use as PCR primers PCR was carried out on a rat brain CC DNA prepn. Two major bands of about 450 bps and 130 bps were found. The 450 bp band corresponded to the expected length between the two CC primer sites, but the 130 bp band could not be predicted from any CC of the previously identified cadherin sequences. The 450 bp and 130 cC of the previously identified cadherin sequences. The 450 bp and 130 cC clones were extracted and sequenced. Nineteen novel partial cDNA CC clones (including sequences corresp. to the PCR primers) are given in Q68951-Q68969 and R58860-R58878. The deduced AA sequences of the CC cDNA clones are homologous to, but distinct from the known cadherins. The cadherins described thus far have highly conserved CC chas sequences in the EC-3 including the consensus sequence CC corresp. sequences in R58879 or R58880 at its end, while the CC corresp. sequences of other subdomains, except for the 5th extra-cc cellular subdomain (EC-5), are D-R-E and the sequence in R58881 creatively. In contrast the deduced AA sequences of the new CC clones that corresp. to cadherin extracellular subdomains include the sequence D-Y-E or D-F-E at one end, but have the sequence CC D-X-N-D-N-X-P-X-F instead of R58879 or R58880 at the other end. CC previously identified cadherins but did not show significant the converse of the sequences of the sequences of the partial clones are homologous to converse and converse of the sequence of converse and converse of the sequence of the sequ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Query Match

Polynuclectide sequences encoding new proto:cadherins - useful for modulating natural binding and regulating activities.

Example; Page 38; 114pp; English.

Two regions of conserved AA sequence, one from the middle of the third cadherin extracellular subdomain (EC-3) and the other from the third cadherin extracellular subdomain (EC-3).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       07-JUL-1994.

Helicobacter pylori nucleic acid sequences and encoded prolypeptide(s) - useful in vaccines to treat or prevent H. pylori infection and for diagnosis of H. pylori infection for diagnosis of H. pylori infection for treat H. pylori claims 14,94; page 677-678; 1145pp; English.

CC This sequence is a H. pylori secreted protein.

CC The protein may be used in a vaccine to prevent or treat H. pylori claims in the protein may be used in a vaccine to prevent or inhibitors. The cuseful as potential H. pylori life cycle activators or inhibitors. The CC H. pylori in a sample and the diagnosis of H. pylori infection. Nucleic cacid sequences complementary to the DNA act as antisense sequences and cc and sequences complementary to the DNA act as antisense sequences and captive the protein can be used in immunoassays to evaluate the abundance against the protein can be used in immunoassays to evaluate the abundance of the pylori (ATCC 55679) was determined from overlapping contic sequence of the pylori specific antigens. The genomic sequence of the pylori (ATCC 55679) was determined from overlapping contics generated by mechanically shearing the bacterial DNA. The sequences were analysed for vaccine development, the amino acid sequences predicted coding regions cc defined by computer evaluation. To identify likely H. pylori antigens for vaccine development, the amino acid sequences predicted from various ORF were analysed for significant homology to other known or exported conterest, particular regions can be isolated from H. pylori by PCR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     cc screening a rat brain cDNA preparation with the primers shown in T03575 cc and T03576. The primers were constructed from portions of the amino acid c sequences of the third and fourth extracellular domains of published cc cadherin sequences. The full length cDNA sequence encoding rat crowdherin pc5 is represented in T03574. The cytoplasmic domain of cadherin interacts with the cytoskeleton through catenins and other cytoskeleton associated proteins. The cytoplasmic domain is not present in all cadherins, but in those which possess it, it is essential for the cadherins adhesive function. The cadherins which do not possess a cytoplasmic domain appear to function via a different method from those with a cytoplasmic domain. These protein sequences are involved in cell-cell adhesion. These sequences may have regulatory functions in the cell, as well as the cell-cell adhesive properties. Antibodies produced against these sequences are useful for modulating the binding activity of these protocadherins, and can be used therapeutically.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match

                                                                                                        Pri Helicobacter pylori nucleic acid sequences and encoded pri Helicobacter pylori nucleic acid sequences to treat or prevent H. pylori prolipheride(s) - useful in vaccines to treat or prevent H. pylori finfection and for diagnosis of H. pylori infection Pri finfection and for diagnosis of H. pylori infection Pri finfection and for diagnosis of H. pylori protein of unspecified function. Prince the protein may be used in a vaccine to prevent or treat H. pylori C. The protein may be used in a vaccine to prevent or treat H. pylori infection or to identify H. pylori polypeptide binding compounds, in the protein as potential H. pylori life cycle activators or inhibitors. The DNA and probes derived from it may be used for the identification of C. H. pylori in a sample and the diagnosis of H. pylori infection. Nucleic acid sequences complementary to the DNA act as antisense sequences and C. can be used to prevent the translation of H. pylori mRNA. Antibodies and distribution of H. pylori-specific antigens. The genomic sequence of C. H. pylori (ATCC 55679) was determined from overlapping contigs generated by mechanically shearing the bacterial DNA. The sequences were analysed for ORF of at least 180 nucleotides, and the predicted coding regions defined by computer evaluation. To identify likely H. pylori antigens for vaccine development, the amino acid sequences predicted from various ORF certains. Having identified and determined the sequences of interest, particular regions can be isolated from H. pylori by PCR camplification for recombinant polypeptide production, e.g. in E. coli
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match

pri chromosomal translocation, and prods. useful in diagnosis and
prods. useful in diagnosis and
prods. useful in diagnosis and
prods. useful in diagnosis and
prods. useful in diagnosis and
prods. The E2A gene (see Q13669), encoding immunoglobulin enhancer-binding
factors E12 and E47 (see Q13670 and Q13671), is localised to the
production of a consistently recurring chromosomal translocation
present in many acute leukemias and is structurally altered by most
t(1,19) chromosomal translocations. The translocation results in
present in many acute leukemias and is structurally altered by most
t(1,19) chromosomal translocations. The translocation results in
present in many acute leukemias and is structurally altered by most
th(1,19) chromosomal translocations. The translocation results in
present in many acute leukemias and is structurally altered by most
th(1,19) chromosomal translocations. The translocation results in
the translocation many (see Q13672 for fusion cDNA) that crosses
the breakpoint between chromosome 1 and 19.

Claim 5; Column 112; 59pp; English.

The present sequence is an antigenic epitope from human cadherin-5, which is a Ca2+ dependent cell adhesion protein. Antibodies or fragments that specifically bind the epitope can be used to purify the cadherin, determine its tissue expression and antagonise its ligand/antiligand binding activities.

Sequence 11 AA;

pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Complete sequence of the desmoglein precursor and evidence for the existence of different desmoglein genes expressed in cell type-specific patterns.
                                                                                                                                                                                                                                                        Koch, P.J.; Walsh, M.J.; Schmelz, M.; Goldschmidt, M.D.; Zimbelmann, R.; Franke, W.W.
Eur. J. Cell Biol. (1990) 53:1-12
Identification of desmoglein, a constitutive desmosomal glycoprotein, as a member of the cadherin family of cell adhesion molecules.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                submitted to the EMBL Data Library, February 1991 838721
